

AIR VIP

high efficiency compressed
air filters

THE REASONS FOR PURCHASING AIR VIP FILTERS

Modern manufacturing industry requires the cleanest, most reliable compressed air supply available. Compromising your compressed air supply can result in a reduction in product quality, affect site safety and can even result in a production line coming to a halt. A modest investment in the AIR VIP range of compressed air filters will pay for itself many times over.

The AIR VIP series meets the requirements of the "PED" 97/23 CE guidelines.

FILTRATION PRINCIPLES

- 1) Direct Interception (removal of coarse particles on the outside of the filtration surface).
- 2) Inertial impaction (removal of particles thanks to the tortuous path formed by the microfibres).
- 3) Diffusion (fine particles adhere to the microfibres thanks to "Brownian motion").

THOUSANDS OF HOURS WITH CONSISTENT EFFICIENCY

The ARS range of filter elements in our AIR VIP series are constructed using multiple filter layers, each of which is used for a specific function. The contaminated air (travelling through the cartridge from inside to out) first passes a pre-filtration layer of resin impregnated cellulose fibres, where particles greater than 5μ retained.

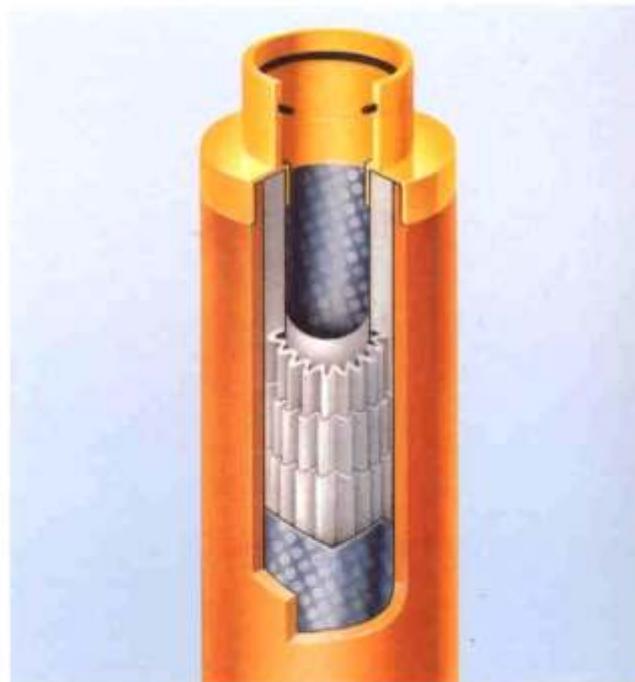

The use of resin for impregnation guarantees the consistent high strength of the filter material, even in the presence of water.

The air then passes through the second filtration layer, which consists of borosilicate microfibres. This allows the capture of particles with sizes down to 0.01 micron and the formation of condensate droplets, which are conveyed to the outer coalescing layers of the cartridge.

This outer barrier collects the separated droplets of water and oil, allowing them to run down to the bottom of the cartridge and into the bowl of the housing assembly. Although the compressed air elements allow liquids to pass through, the retained solids eventually result in them becoming blocked.

The pleated construction of our ARS range of filter elements provides a very high surface area for the retention of the solid particles (approx. 4-5 times when compared to the conventional rolled filter of most manufacturers), the result is an exceptionally long life & very low pressure drop for the element.

SAFETY SYSTEM

Prevents housing being opened whilst in operation.

EASE OF INSTALLATION

The filter cartridge is retained using a positive seal O-ring. This design feature allows the quick and easy replacement of the filter element, eliminating the need for a tie rod.

COLOUR CODE

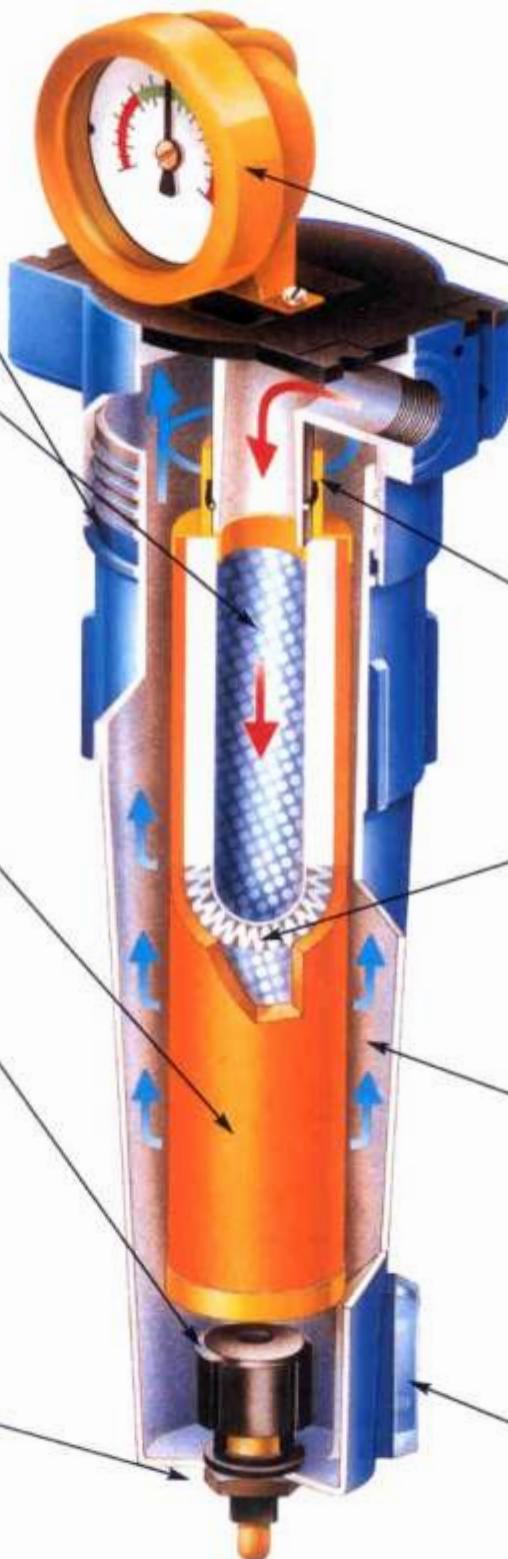

The element grade is clearly identified by the use of different coloured outer foam sleeves.

AUTOMATIC CONDENSATE DRAIN

The drain has three functions:
Automatic: compressed air operation - normal
Semi-automatic: operates under a no pressure condition
Manual

SPACE REDUCTION

Only 6 cm of clearance under the filter bowl is required during element replacement.

**DIFFERENTIAL GAUGE**

The differential gauge XAM-100 can be mounted facing either direction and accurately indicates when the filter element needs replacing.

O-RING SEAL

An O-ring seal ensures positive element location and eliminates the possibility of bypass.

PLEATED FILTER ELEMENT

Offers a high filtration surface area, low differential pressure loss and long life.

DUAL LAYER PROTECTION OF BODY

The surface treatment of the interior and exterior of the housing assures excellent corrosion resistance.

LEVEL INDICATOR

Displays the presence of collected liquid.

"RM" grade

10 micron
15 ppm

"RF" grade

1 micron
8 ppm
replacement at: 0.6 bar
Air Quality to ISO 8573.1

Compressed air pre-filtration:

Removal of condensate and solid particles, protecting air receivers and refrigerant dryers.

Pre filter for the RB & RA grades.
After filter collecting dust and debris generated by Desiccant dryers.

**"RB" grade**

1 micron
0.1 ppm

Air Quality to ISO 8573.1
Max. particle size Class 2
Max. oil content Class 2
Clean pressure drop:
60 mbar

replacement at: 0.6 bar

Oil separation and compressed air filtration:

Pre filter for refrigeration driers.
Pre filter for the RA & CA grades.
Vacuum pump inlet protection filter.
Industrial filtration for general purpose air
Removal of particles down to 1µ, coalesced water and oil (liquid).
Max. remaining oil content of 0.1 ppm at 21°C.

**"RA" grade**

0.01 micron
0.01 ppm

Air Quality to ISO 8573.1
Max. particle size Class 1
Max. oil content Class 1
Clean pressure drop:
80 mbar

replacement at: 0.6 bar

Oil separation and precision filtration of compressed air and gases for the protection of:

Adsorption driers
Sophisticated instrumentation
Spray paint plants
Electronics, food & textiles industries
Removal of particles down to 0.01µ including oil & water aerosols, which provides a max. remaining oil content of 0.01 mg/m³ at 21°C.

**"CA" grade**

0.003 ppm

Air Quality to ISO 8573.1
Max. particle size Class 1
Max. oil content Class 1
Clean pressure drop:
140 mbar

replacement at: 1000 hours

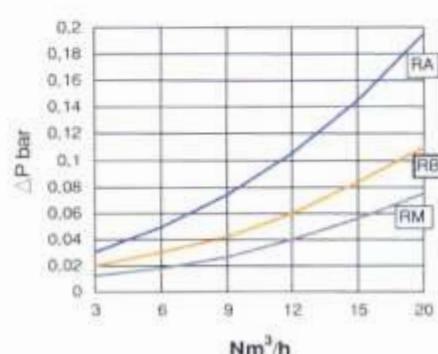

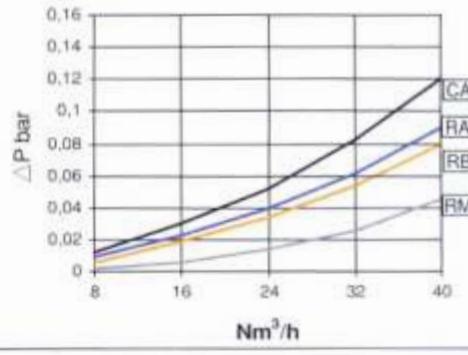

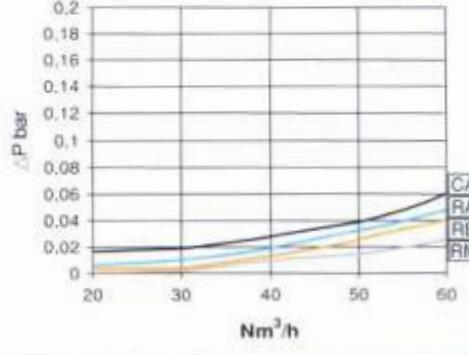

Elimination of odours and vapours from the compressed air.

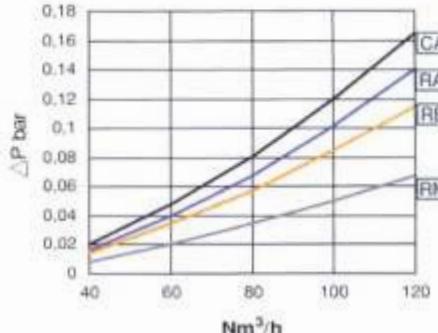

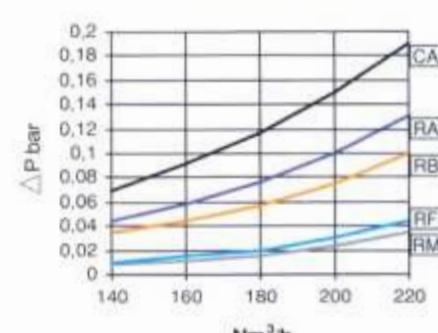

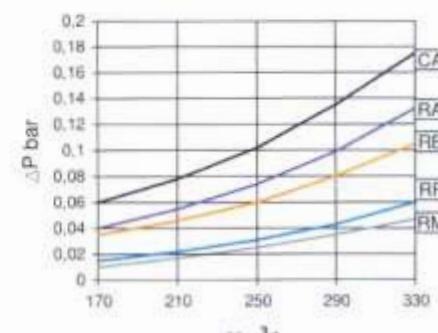

Always to be preceded by the "RA" grade.
Compressed air for:

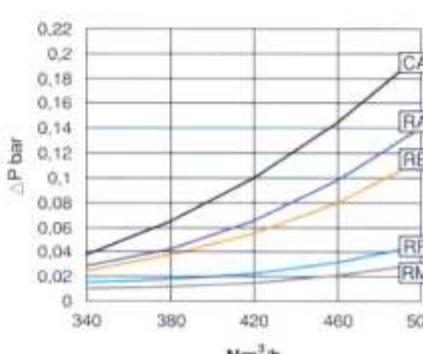

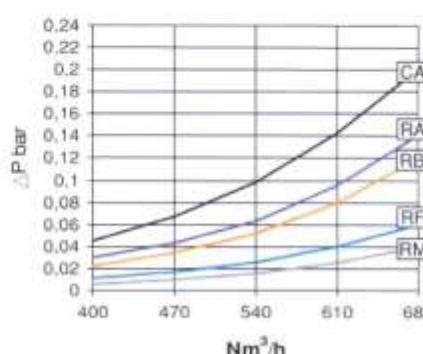

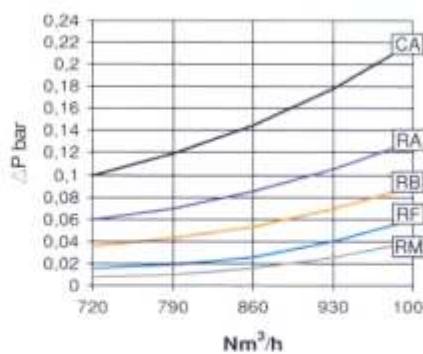

- food & beverage
- pharmaceutical
- process air
- textiles, electronics

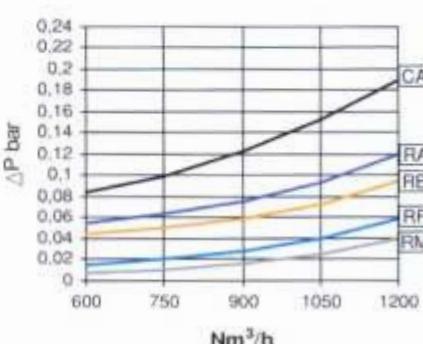

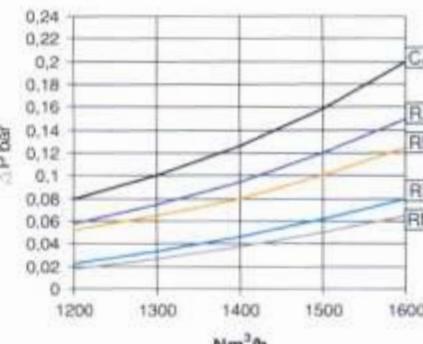

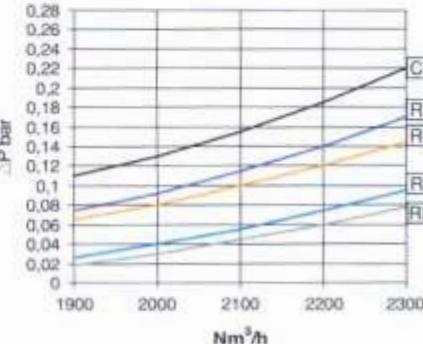

Removal of oil vapour and hydrocarbons, which provides a max. remaining oil content of 0.003 mg/m³ at 21°C.

TYPICAL APPLICATIONS FOR COMPRESSED AIR SYSTEMS

FOR GENERAL USE

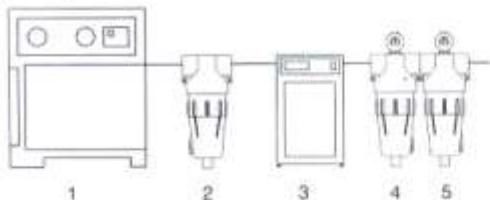

Air purity ISO 8573-1 : class 2.-.2

2- Prefilter grade RM

WITH DEW POINT AT +3°C

Air purity ISO 8573-1 : class 1.4.1

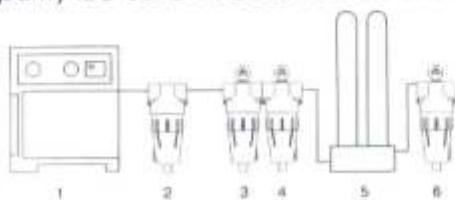

3- DRY- VIP drier

4- Filter grade RB

5- Filter grade RA

WITH DEW POINT FROM -20°C to -40°C

Air purity ISO 8573-1 : class 1.2.1 or 1.1.1

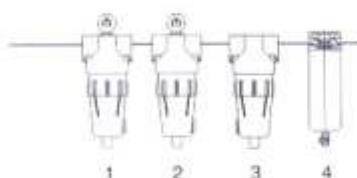

2- Prefilter grade RM

5- DRY PLUS adsorption drier

6- After filter grade RF

PURE AND STERILE AIR - POINT OF USE

Air purity ISO 8573-1 : class 1.-.1

4 - Sterile filter grade SL

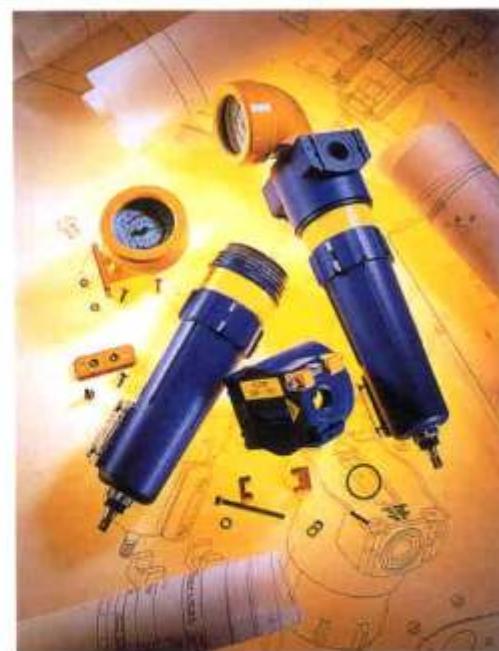

MODULAR SYSTEM

INSTALLATION IN SERIES

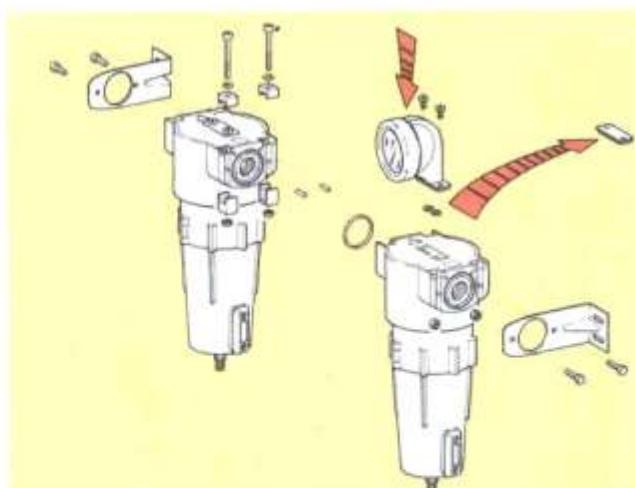

Mounting kits are available which enables the installation of several filters in series. The design of our compact assembly allows the use of a multi stage system to be used where minimal space is available.

DESIGN OF EACH DETAIL

EASY INSTALLATION

All the components, mounting brackets, clamps and differential gauges are easily assembled.

XAC -21-230

Standard voltage: 230V-50/60
 Operating pressure: 0.8-16 bar
 Operating temperature: +1/60°C
 Weight: 700 gr.

The automatic condensate drain XAC-21-230 is used for the removal of condensate & oil emulsion from the compressed air system, without needlessly wasting expensive energy. The XAC-21 uses a capacitive level sensor which prevents the venting of compressed air during operation.

XAM-100

Bourdon valve operation
 Max operating pressure: 16 bar
 Max operat. temperature: 60°C
 Scale: 0-1.4 bar
 Weight: 620 gr.

The differential gauge XAM-100 measures the pressure difference between the inlet and outlet of the filter assembly. With the scale being centrally set at "0", the gauge can be mounted through a rotation of 180°. Element replacement is advised when the pointer enters into the red coloured field.

XAD-251

Operating pressure: 0.6-16 bar
 Operating temperature: +5 / 80°C
 Weight: 65 gr.

The automatic float condensate drain is specified from models CDF -30 to the CDF-1050. The drain can run in 3 different ways:

Automatic: the elevation of the float opens the pilot valve, then the compressed air opens the shutter to allow the liquid to discharge.

Semi-automatic: to avoid liquid discharging when the pressure drops under 0.6 bar the condensate drain opens, venting the collected liquid.

Manual: the liquid is discharged by rotating the brass ratchet anti-clockwise.

XAD-651

Operating pressure: 0-16 bar
 Operating temperature: +5 / 80°C
 Weight: 0.6 Kg.

Automatic float condensate drain with aluminium body for installation where large amounts of condensate need to be discharged from the air line. The float mechanism is manufactured from stainless steel.
